I had created a report based on AWS + Snowflake + Tableau pipeline. First, I had created the SQL integration script and the Tableau dashboard, the next step is to **translate that into a structured AWS-powered report**. Here's my found

📊 AWS Energy Consumption Report

1. **Data Source & Integration**
   - **Storage**: AWS S3 bucket (s3://tableau-2-project)
   - **Integration**: Snowflake external stage via TBL_Integration
   - **Pipeline**: Data copied into tableau_dataset → transformed into energy_consumption table
2. **Key Metrics**
   - **Total Energy Consumption (KWH)**
     - By Country: Australia (80,410), USA (50,697), New Zealand (65,414) ...
     - By Region: Europe (163,213), Africa (156,366), Asia (151,699)
   - **Cost Savings (USD)**
     - By Country: New Zealand (16,862), USA (11,022), Canada (10,727)
     - By Region: South America (34,692), Africa (34,444), Europe (33,561)
   - **Energy Source Contribution**
   - Wind: 214,492 KWH, $47,507 savings
   - Solar: 179,372 KWH, $40,681 savings
   - Hydro: 184,101 KWH, $37,871 savings
3. **Insights**
   - 🌍 **Regional Leaders**: Europe leads in consumption, South America leads in cost savings.
   - ⚡ **Energy Source Efficiency**: Wind energy provides the highest savings, followed closely by solar.
   - 💰 **Top Performers**: New Zealand and Australia show strong savings relative to consumption.
4. **Business Impact**
   - Supports **policy planning** for renewable adoption.
   - Identifies **high ROI regions** for subsidy allocation.
   - Provides a **benchmark for household-level energy efficiency**.
